AP® Chemistry
2003 Sample Student Responses

The materials included in these files are intended for use by AP teachers for course and exam preparation; permission for any other use must be sought from the Advanced Placement Program®. Teachers may reproduce them, in whole or in part, in limited quantities for noncommercial, face-to-face teaching purposes. This permission does not apply to any third-party copyrights contained herein. This material may not be mass distributed, electronically or otherwise. These materials and any copies made of them may not be resold, and the copyright notices must be retained as they appear here.

These materials were produced by Educational Testing Service® (ETS®), which develops and administers the examinations of the Advanced Placement Program for the College Board. The College Board and Educational Testing Service (ETS) are dedicated to the principle of equal opportunity, and their programs, services, and employment policies are guided by that principle.

The College Board is a national nonprofit membership association whose mission is to prepare, inspire, and connect students to college and opportunity. Founded in 1900, the association is composed of more than 4,300 schools, colleges, universities, and other educational organizations. Each year, the College Board serves over three million students and their parents, 22,000 high schools, and 3,500 colleges through major programs and services in college admissions, guidance, assessment, financial aid, enrollment, and teaching and learning. Among its best-known programs are the SAT®, the PSAT/NMSQT®, and the Advanced Placement Program® (AP®). The College Board is committed to the principles of equity and excellence, and that commitment is embodied in all of its programs, services, activities, and concerns.

8A1

Compound Name	Compound Formula	ΔH°_{vap} (kJ mol^{-1})
Propane	$CH_3CH_2CH_3$	19.0
Propanone	CH_3COCH_3	32.0
1-propanol	$CH_3CH_2CH_2OH$	47.3

8. Using the information in the table above, answer the following questions about organic compounds.

(a) For propanone,

(i) draw the complete structural formula (showing all atoms and bonds);

(ii) predict the approximate carbon-to-carbon-to-carbon bond angle.

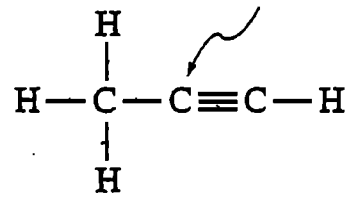
(b) For each pair of compounds below, explain why they do not have the same value for their standard heat of vaporization, ΔH°_{vap}. (You must include specific information about <u>both</u> compounds in each pair.)

(i) Propane and propanone

(ii) Propanone and 1-propanol

(c) Draw the complete structural formula for an isomer of the molecule you drew in part (a) (i).

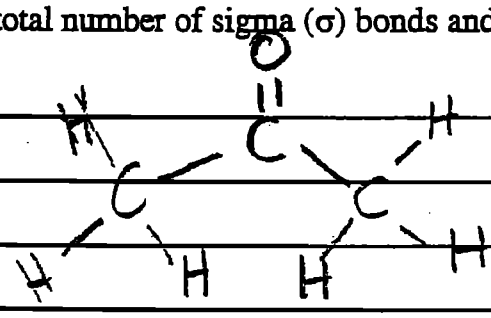
(d) Given the structural formula for propyne below,



(i) indicate the hybridization of the carbon atom indicated by the arrow in the structure above;

(ii) indicate the total number of sigma (σ) bonds and the total number of pi (π) bonds in the molecule.

a) i)



ii) The bond angle between  will be approximately 120° (sp^2 hybridization)

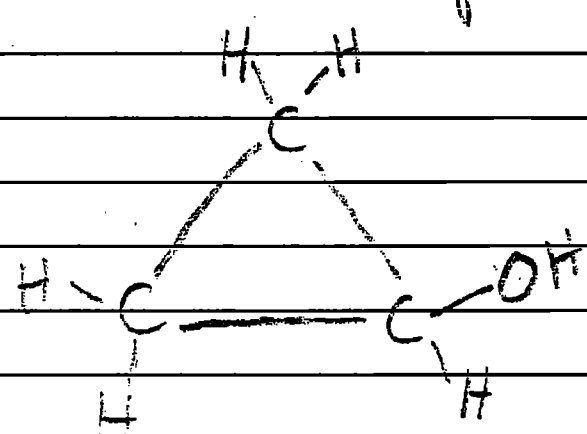
b) i) propane is a non polar compound bearing only London dispersion forces. Propanone, however, has polar bonds

ADDITIONAL PAGE FOR ANSWERING QUESTION 8.

which induce dipoles, increasing bonding between molecules. This requires propanone to be heated more strongly to match its vapor pressure to that of the air above it.

ii) While propanone is a polar compound with dipole-dipole interactive forces, 1-propanol is also polar, but can engage in hydrogen bonding at one end, which strengthens intermolecular forces and raise the heat of vap.

c)



cyclopropanol

d) i) linear (sp) hybridization

ii) 6 σ bonds and 2 π bonds

Compound Name	Compound Formula	ΔH°_{vap} (kJ mol^{-1})
Propane	$CH_3CH_2CH_3$	19.0
Propanone	CH_3COCH_3	32.0
1-propanol	$CH_3CH_2CH_2OH$	47.3

8. Using the information in the table above, answer the following questions about organic compounds.

(a) For propanone,

(i) draw the complete structural formula (showing all atoms and bonds);

(ii) predict the approximate carbon-to-carbon-to-carbon bond angle.

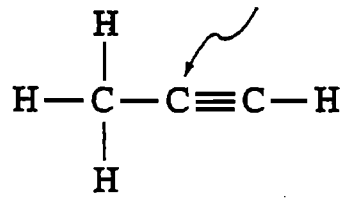
(b) For each pair of compounds below, explain why they do not have the same value for their standard heat of vaporization, ΔH°_{vap}. (You must include specific information about <u>both</u> compounds in each pair.)

(i) Propane and propanone

(ii) Propanone and 1-propanol

(c) Draw the complete structural formula for an isomer of the molecule you drew in part (a) (i).

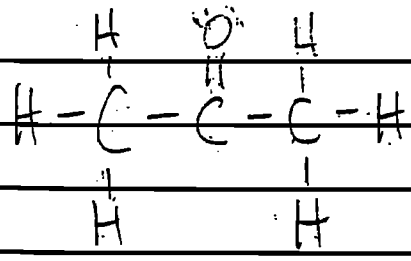
(d) Given the structural formula for propyne below,



(i) indicate the hybridization of the carbon atom indicated by the arrow in the structure above; sp linear

(ii) indicate the total number of sigma (σ) bonds and the total number of pi (π) bonds in the molecule. 6 sigma 2π

a) i)



ii) The carbon to carbon bond angle is the same as the bond angle for a trigonal planar configuration. This should be 120°.

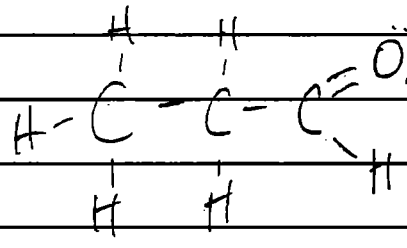
b) i) The heat of vaporization is higher for propanone than propane because of the O in propanone. The double bond takes more energy to break. Propane does not have any

ADDITIONAL PAGE FOR ANSWERING QUESTION 8.

double bonds and therefore has the lower heat of vaporization.

ii) Although propanone has a double bond between carbon and oxygen, 1-propanol has a stronger type of bond that increases the heat of vaporization. This is the hydrogen bonding between the O-H. The hydrogen bond is difficult to break and requires more heat.

c)



d) i) The carbon atom is linear so it has sp hybridization.

ii) Each single bond is also a sigma bond and a triple bond has one sigma and two pi bonds. Therefore, there are 6 sigma bonds and 2 pi bonds.

Compound Name	Compound Formula	ΔH°_{vap} (kJ mol^{-1})
Propane	$CH_3CH_2CH_3$	19.0
Propanone	CH_3COCH_3	32.0
1-propanol	$CH_3CH_2CH_2OH$	47.3

8. Using the information in the table above, answer the following questions about organic compounds.

(a) For propanone,

(i) draw the complete structural formula (showing all atoms and bonds);

(ii) predict the approximate carbon-to-carbon-to-carbon bond angle.

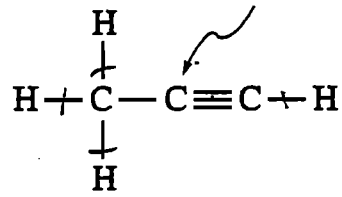
(b) For each pair of compounds below, explain why they do not have the same value for their standard heat of vaporization, ΔH°_{vap}. (You must include specific information about <u>both</u> compounds in each pair.)

(i) Propane and propanone

(ii) Propanone and 1-propanol

(c) Draw the complete structural formula for an isomer of the molecule you drew in part (a) (i).

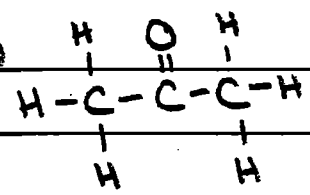
(d) Given the structural formula for propyne below,



(i) indicate the hybridization of the carbon atom indicated by the arrow in the structure above;

(ii) indicate the total number of sigma (σ) bonds and the total number of pi (π) bonds in the molecule.

(A)(i)



(ii) 120°

(B) (i) propane has a lower ΔH°_{vap} than propanone bc it lacks the extra atom of O that is double bonded to a C. Double bonds are harder to break apart than single bonds – they are shorter + stronger propane has only single bonds propanone has a double bond.

8C2

ADDITIONAL PAGE FOR ANSWERING QUESTION 8.

(B) (ii) 1-propanol has a high bp than propanone bc it has stronger H-bonds that are more difficult to break up. Propanone's O is not bonded to an H → it simply has dispersion forces

(C)

(D) - (i) sp

(ii) $\sigma = 5$

$\pi = 2$
