2003 Sample Student Responses

The materials included in these files are intended for use by AP teachers for course and exam preparation; permission for any other use must be sought from the Advanced Placement Program®. Teachers may reproduce them, in whole or in part, in limited quantities for noncommercial, face-to-face teaching purposes. This permission does not apply to any third-party copyrights contained herein. This material may not be mass distributed, electronically or otherwise. These materials and any copies made of them may not be resold, and the copyright notices must be retained as they appear here.

These materials were produced by Educational Testing Service® (ETS®), which develops and administers the examinations of the Advanced Placement Program for the College Board. The College Board and Educational Testing Service (ETS) are dedicated to the principle of equal opportunity, and their programs, services, and employment policies are guided by that principle.

The College Board is a national nonprofit membership association whose mission is to prepare, inspire, and connect students to college and opportunity. Founded in 1900, the association is composed of more than 4,300 schools, colleges, universities, and other educational organizations. Each year, the College Board serves over three million students and their parents, 22,000 high schools, and 3,500 colleges through major programs and services in college admissions, guidance, assessment, financial aid, enrollment, and teaching and learning. Among its best-known programs are the SAT®, the PSAT/NMSQT®, and the Advanced Placement Program® (AP®). The College Board is committed to the principles of equity and excellence, and that commitment is embodied in all of its programs, services, activities, and concerns.

1. Since Hill Valley High School eliminated the use of bells between classes, teachers have noticed that more students seem to be arriving to class a few minutes late. One teacher decided to collect data to determine whether the students' and teachers' watches are displaying the correct time. At exactly 12:00 noon, the teacher asked 9 randomly selected students and 9 randomly selected teachers to record the times on their watches to the nearest half minute. The ordered data showing minutes after 12:00 as positive values and minutes before 12:00 as negative values are shown in the table below.

(a) Construct parallel boxplots using these data.

- Students
- Teachers
- Minutes away from 12:00

\[
\begin{align*}
\text{Students} & \quad \min = -4.5 \\
& \quad \text{Q}_1 = -1.75 \\
& \quad \text{Med} = 0 \\
& \quad Q_3 = 1 \\
& \quad \max = 5 \\
\end{align*}
\]

\[
\begin{align*}
\text{Teachers} & \quad \min = -2 \\
& \quad \text{Q}_1 = -1.5 \\
& \quad \text{Med} = -1 \\
& \quad Q_3 = 0 \\
& \quad \max = 0.5 \\
\end{align*}
\]
(b) Based on the boxplots in part (a), which of the two groups, students or teachers, tends to have watch times that are closer to the true time? Explain your choice.

The teachers have watch times that are closer to the true time. This is evident because the IQR for the teachers is smaller. Although the median is not 0, using the IQR, we can see that 50% of the teachers’ watch times fall within the range of -1.5 to 0 minutes away from 12:00. Using the IQR of the students, we can see that 50% of the students’ watch times fall within the range -1.75 to 1 minute away from 12:00. Also, the full range of students’ time is much larger than the range of the teachers’ time. Although this does not necessarily always mean that the data set with the smaller range is more accurate, it is definitely true in this case.

(c) The teacher wants to know whether individual student’s watches tend to be set correctly. She proposes to test $H_0: \mu = 0$ versus $H_1: \mu \neq 0$, where $\mu$ represents the mean amount by which all student watches differ from the correct time. Is this an appropriate pair of hypotheses to test to answer the teacher’s question? Explain why or why not. **Do not carry out the test.**

This will not answer the teacher’s question because the hypothesis of $H_0: \mu = 0$ versus $H_1: \mu \neq 0$ does not test individual students’ watches like she wants to. This would simply test the accuracy of the mean of the students’ watches.
STATISTICS
SECTION II
Part A
Questions 1-5
Spend about 65 minutes on this part of the exam. Percent of Section II grade—75

(b) Based on the boxplots in part (a), which of the two groups, students or teachers, tends to have watch times that are closer to the true time? Explain your choice.

Based on the data, teachers tend to have watch times that are closer to the true time. I chose this because the teacher’s boxplot was much more compact than the students. It had a smaller range of numbers within its min/max range. Also, the inner quartile range is smaller, making the values closer.

(c) The teacher wants to know whether individual student’s watches tend to be set correctly. She proposes to test $H_0: \mu = 0$ versus $H_a: \mu \neq 0$, where $\mu$ represents the mean amount by which all student watches differ from the correct time. Is this an appropriate pair of hypotheses to test to answer the teacher’s question? Explain why or why not. Do not carry out the test.

No, the teacher is looking to find the students with correct time, $\mu = 0$ is the mean amount the student’s watch differ. Since the student’s times are not known, it is better to test $H_0: \mu - \mu_2 = 0$ with $\mu$, being real time and $\mu_2$ being mean student time.
