

## AP Calculus AB 2000 Student Samples

**The materials included in these files are intended for non-commercial use by AP teachers for course and exam preparation; permission for any other use must be sought from the Advanced Placement Program. Teachers may reproduce them, in whole or in part, in limited quantities, for face-to-face teaching purposes but may not mass distribute the materials, electronically or otherwise. These materials and any copies made of them may not be resold, and the copyright notices must be retained as they appear here. This permission does not apply to any third-party copyrights contained herein.**

These materials were produced by Educational Testing Service (ETS), which develops and administers the examinations of the Advanced Placement Program for the College Board. The College Board and Educational Testing Service (ETS) are dedicated to the principle of equal opportunity, and their programs, services, and employment policies are guided by that principle.

The College Board is a national nonprofit membership association dedicated to preparing, inspiring, and connecting students to college and opportunity. Founded in 1900, the association is composed of more than 3,900 schools, colleges, universities, and other educational organizations. Each year, the College Board serves over three million students and their parents, 22,000 high schools, and 3,500 colleges, through major programs and services in college admission, guidance, assessment, financial aid, enrollment, and teaching and learning. Among its best-known programs are the SAT<sup>®</sup>, the PSAT/NMSQT<sup>™</sup>, the Advanced Placement Program<sup>®</sup> (AP<sup>®</sup>), and Pacesetter<sup>®</sup>. The College Board is committed to the principles of equity and excellence, and that commitment is embodied in all of its programs, services, activities, and concerns.

## Work for problem 3(a)

a. minimum -  $(-1,)$ 

Candidate theorem says  $f$  may have a minimum on an open interval where  $f'(x) = 0$  or does not exist.  $f'(x)$  exists everywhere and equals 0 at  $-5, -1,$  and  $5$ .  $f'(x)$  changes sign at  $-1$  from negative to positive, which means  $f(x)$  has stopped increasing and started increasing. This is the only candidate to change sign in this manner.

## Work for problem 3(b)

b. maximum -  $(-5)$ 

The Candidate theorem says that  $f$  may have a maximum on an open interval where  $f'(x) = 0$  or does not exist.  $f'(x)$  exists everywhere and equals 0 at  $-5, -1,$  and  $5$ .  $f'(x)$  changes sign from negative to positive at  $-1$ , does not change sign at  $5$ , and changes sign from positive to negative at  $-5$ . Sign change from positive to negative indicates a relative maximum, because  $f(x)$  has stopped increasing and started decreasing.

Work for problem 3(c)

$$c. f'(x) < 0 - -7 < x < -3, 2 < x < 3, 3 < x < 5$$

Work for problem 3(d)

$$d. \max - (7)$$

The Candidate Theorem tells us that when  $f$  may have its absolute maximum when  $f'(x) = 0$  and at the endpoints of a closed interval. This leaves us  $(-7, -5, -1, 5, 7)$ .  $f(x)$  must be increasing up to the max (eliminates  $-7$  and  $-1$ ) and cannot increase more immediately after the max (eliminates  $5$ ). We know  $f(x)$  is increasing when  $f'(x)$  is positive. To decide between  $-5$  and  $7$ , we can see that there is more increase of  $f(x)$  (positive area under the curve of  $f'(x)$ ) than decrease (negative area) between  $-5$  and  $7$ . So  $f(x)$  must have increased more than decreased between  $-5$  and  $7$ , making  $f(7)$  larger than  $f(-5)$ .

END OF PART A OF SECTION II

IF YOU FINISH BEFORE TIME IS CALLED, YOU MAY CHECK YOUR WORK ON PART A ONLY. DO NOT GO ON TO PART B UNTIL YOU ARE TOLD TO DO SO.

Work for problem 3(a)

$f$  attains relative minima at  $x = -7$ , because it is an end point from which  $f$  increases, and at  $x = -1$ , because  $f'$  changes from negative to positive here, indicating a change in  $f$  from decreasing to increasing, indicative of a local minimum

Work for problem 3(b)

$f$  attains relative maxima at  $x = 7$ , because it is an end point of the function to which  $f$  increases, and at  $x = -5$ , because  $f'$  changes from positive to negative here, indicating a change in  $f$  from increasing to decreasing, indicative of a local maximum

Continue problem 3 on page 9.

Work for problem 3(c)

$f'(x)$  decreases  $(-7, -3) \cup (2, 5)$   
 $f'(x)$  increases  $(-3, 2) \cup (5, 7)$

$f''(x) < 0$  where  $f'(x)$  decreases

$\therefore f''(x) < 0$  on the intervals  $(-7, -3) \cup (2, 5)$

Work for problem 3(d)

$$x = 7$$

Absolute maxima occur where  $f'(x) = 0$  and is changing from positive to negative OR at the end points of the function. The area under the given curve  $f'(x)$ , which is  $f(x)$ , increases the most  $(-1, 7)$ , more than  $(-7, -5)$  where the other local maximum occurs at  $x = -5$ . Thus the absolute maximum occurs at  $x = 7$ .

END OF PART A OF SECTION II

IF YOU FINISH BEFORE TIME IS CALLED, YOU MAY CHECK YOUR WORK ON PART A ONLY. DO NOT GO ON TO PART B UNTIL YOU ARE TOLD TO DO SO.

Work for problem 3(a)

at  $x = -1$ ,  $f$  attains a relative minimum, because  $f'(-1) = 0$  and  $f'(x) \rightarrow \frac{-}{-1} \frac{+}{+}$   
 therefore at  $x = -1$  there is a relative minimum

Work for problem 3(b)

at  $x = -5$ ,  $f$  attains a relative maximum because  $f'(-5) = 0$  and  
 $f'(x) \rightarrow \frac{+}{-5} \frac{-}{-}$ , therefore at  $x = -5$  there is a relative maximum

Continue problem 3 on page 9.

3 3 3 3 3 3 3 3 3  $F_2$

Work for problem 3(c)

$$[-7, -3] \quad f''(x) < 0$$
$$[2, 5]$$

The graph of  $f(x)$  is concave down during these intervals

---

Work for problem 3(d)

at  $x=7$  the graph of  $f$  attains its absolute maximum because  
~~the~~  $f'(x)$  has been positive for most of the interval, therefore  
at  $x=7$ ,  $f$  attains its highest point.
