2001 Scoring Guidelines

The materials included in these files are intended for non-commercial use by AP teachers for course and exam preparation; permission for any other use must be sought from the Advanced Placement Program. Teachers may reproduce them, in whole or in part, in limited quantities, for face-to-face teaching purposes but may not mass distribute the materials, electronically or otherwise. These materials and any copies made of them may not be resold, and the copyright notices must be retained as they appear here. This permission does not apply to any third-party copyrights contained herein.
Question 1

1. (a) Maximum 4 points total for (i) and (ii)

(i) 1 point for correct setup (MUST include units)
   1 point for correct answer (units not needed/ignore incorrect units)

\[(2,000 \text{ ft}^2) (80,000 \text{ BTU/ft}^2) (1 \text{ ft}^3/1000 \text{ BTU}) = 160,000 \text{ ft}^3 \text{ natural gas}\]

Note: if 80% is calculated in part (i), then

\[.8 x = 160,000 \text{ ft}^3 \text{ and correct answer} = 200,000 \text{ ft}^3 \text{ natural gas}\]

OR

\[.8 x = 80,000 \text{ BTU/ft}^2, x = 100,000 \text{ BTU/ft}^2, \text{ therefore} (2,000 \text{ ft}^2) (100,000 \text{ BTU/ft}^2) (1 \text{ ft}^3/1000 \text{ BTU}) = 200,000 \text{ ft}^3\]

OR

\[(2000 \text{ ft}^2) (80,000 \text{ BTU/ft}^2) (1 \text{ ft}^3/1000 \text{ BTU}) (1 \text{ BTU (in)/0.8 BTU (out)} = 200,000 \text{ ft}^2\]

(ii) 1 point for correct setup (MUST include units) and answer

\[(160,000 \text{ ft}^3) (\$5.00/1000 \text{ ft}^3) = \$800\]

OR

\[(200,000 \text{ ft}^3) (\$5.00/1000 \text{ ft}^3) = \$1000\]

OR

\[.8 x = \$800, \text{ therefore} x = \$1000\]

1 point for including the 80% calculation correctly in either part (i) or part (ii).

Note: if answer in part (i) is incorrect, yet calculations in part (ii) are done correctly using the answer in part (i), then the point for part (ii) is awarded.
1. (b) Maximum 3 points

Must identify action and describe.

- Use first three (3) responses given
- Responses must be tied to this house
- No credit for woodburning stove since it is given in part “c” unless it includes a more detailed description

Examples of appropriate action and description:

- Add thicker insulation or higher R-value insulation or “superinsulation”
- Add insulation to attic, exterior walls, ducts, or areas currently not insulated
- Install double, triple, low-E (low emissivity), or storm windows
- Cover exterior windows with plastic
- Caulk, seal, weather-strip around windows and doors, repair windows to seal leaks
- Lock/close windows and doors
- Use solar heating with a specific example
- Place windows on southern, eastern, and western exposures
- Open shades/blinds during the day and close at night
- Lower (turn off) thermostat during the day when no one is home
- Lower thermostat and wear layers of clothing and blankets
- Lower thermostat to remain a few degrees cooler to use less energy and save money
- Add carpet to improve insulation
- Install programmable thermostat (must give specific heat conserving use)
- Close off unused rooms/areas
- Install a higher efficiency furnace
- Install ceiling fan to more evenly distribute heat
- Install stone flooring/adobe or brick walls/trombe wall to absorb heat/redirect/act as a heat sink
- Plant windbreak or shelterbreak to guide wind over and around building
- Add straw bales between walls or outside exterior walls
- Install woodburning stove (fireplace) with additional vents for heat distribution
- Install darker roof tiles
- Change to darker exterior wall color
- Take thermal picture, IR picture to identify leaks
- Maintain furnace/change filters regularly
- Use residual heat from clothes dryer/oven
- Install insulation behind wall outlets/light switches
- Remove/avoid planting trees near south windows
Question 1 (cont.)

1. (c) Maximum 4 points

<table>
<thead>
<tr>
<th>Positive Impact</th>
<th>1 point</th>
<th>Consequence</th>
<th>1 point</th>
</tr>
</thead>
<tbody>
<tr>
<td>Negative Impact</td>
<td>1 point</td>
<td>Consequence</td>
<td>1 point</td>
</tr>
</tbody>
</table>

**Note:**
- Use first positive and first negative given
- Discussion of other fossil fuels not appropriate
- Impact and consequence must be linked
- Some students may begin their discussion with consequences and receive a consequence point without the impact point

**Positive Impact**

- Uses renewable resource as opposed to nonrenewable resource
- Burning new carbon vs. old carbon
- Use of local vs. transported fuel
- Burning wood conserves natural gas (fossil fuels)
- Ash residue used as fertilizer

**Examples of Appropriate Consequences**

- Specific impact of reduced extraction/processing transport of natural gas
- Reduce pollutant infiltration to groundwater
- Less subsidence
- Less habitat loss (pipelines)
- Reduces methane leaks from pipeline
- Returns nutrients to the soil

**Negative Impact**

- CO₂ released leading to global warming
- CO released leading to increased indoor air pollution
- Nitrogen Oxides released leading to acid deposition, photochemical smog
- Particulates (ash) released leading to air pollution
- Wood (trees) used non-sustainably or larger amounts of wood needed to produce same number of BTUs leading to deforestation

**Examples of Appropriate Consequences**

- Specific impact of increased global warming: shifting agricultural areas, change in sea level, shifting biomes, weather extremes, loss of habitat
- Specific impact of CO poisoning: CO binds with hemoglobin, unconsciousness, asphyxiation
- Specific impact of increased nitrogen oxides adverse effects on trees, soils, aquatic life in lakes, respiratory problems
- Specific impact of increased air pollution increased respiratory problems, reduced visibility
- Specific impact of deforestation habitat loss, soil erosion, increased CO₂ levels, decreased biodiversity, desertification, interruption of nutrient cycles
Question 2

2. (a) 4 points possible, 3 points internal maximum

2 points for correctly identifying the five components (oak tree, gypsy moth, mice, deer, ticks) of the food web AND showing the proper connections (doesn’t have to have arrows)

In this section, it is NOT acceptable to only specify “acorn” — gypsy moths do not eat acorns.

1 point each for the following:

• placing arrows in the direction of energy flow
• labeling trophic levels

Note: these points can be awarded even if the student missed one of the components or one of the connections in the food web.

The above is an example of a food web that would earn the student 3 points.
2. (b) 4 points

1 point for the hypothesis IF the hypothesis is connected to the question AND the experiment, and is stated in a hypothesis format (i.e., can’t just restate the question).

Since this hypothesis is supposed to be an answer to the question “How are acorn production and moth population related?”, the student must use the document to formulate one of three hypothesis forms.

Note: these are general forms the hypothesis might take. In order to earn a point, the student must specify the direction of change, i.e., increasing or decreasing:

(1) change in moths $\rightarrow$ change in acorns (moths eat leaves and reduce acorn production)
(2) change in acorns $\rightarrow$ change in moths (this can only happen through the mouse connection, and this fact must be demonstrated in the hypothesis and/or the experiment in order to earn the hypothesis point)
(3) null hypothesis (i.e., there is no relationship)

Sample hypotheses:
- If the number of gypsy moths increase then the number of acorns will decrease (due to defoliation and stress on the oak trees)
- If there is a decrease in gypsy moths, there will be an increase in acorns
- An increase in acorns will lead to increased mouse population which will decrease the moth population
- If acorns increase, then mice will preferentially eat the acorns, leading to an increase in gypsy moth population

Student may also state their hypothesis as a NULL hypothesis, i.e.:
- The number of gypsy moths in an oak forest will have no impact on the number of acorns produced
- The number of acorns produced will have no impact on the mouse population, and thus no impact on the number of gypsy moths
- Mice have no preferential food, therefore the number of acorns produced will not impact the mice’s feeding habits and thus have no impact on the number of gypsy moths
Question 2 (cont.)

Up to 3 points for an experiment that addresses the question (does not necessarily have to be linked to the hypothesis):

- **1 point** for experiment which clearly indicates measurement over a “reasonable” amount of time (not acceptable: days or a few months; for a controlled experiment at least one full cycle of the oak trees is needed)

- **1 point** for a clear indication of a control (see “Examples of Experiment Design” below for more detail)

- **1 elaboration point** available
  - e.g., discussion of testing for significant correlation between organisms
  - e.g., types of graphs they will produce with the data gathered
  - e.g., an in-depth discussion of the technique of counting species by capture and release

**Examples of Experiment Design**

**Experimental** — in this type the student is doing a more traditional type of experiment where there is at least one control site and one experimental site designated, and a variable is manipulated in the experimental site.

- Need at least two sites and a true experimental control (i.e., the absence of the variable to be tested) at one of the sites (control point)
- Manipulate moths (must have a count!) — either natural or in lab — count acorns; over at least one cycle (measurement point)
- Manipulate acorns (must have a count!) — natural sites only — count mice and moths; over at least one cycle (measurement point)

**Observational** — in this type of experiment the student is not manipulating a variable, but making long-term measurements and doing statistical analysis to determine if there is any significant correlation between the populations.

- May involve a single site or multiple sites over a long period of time
- Needs specification of a “reasonable” amount of time, i.e., multiple oak cycles (control point) **OR**
- Specification that measurements will be made over at least one oak cycle AND then compared to a baseline data set (control point)
- Must count all relevant species (measurement point)

An elaboration point is ONLY given if the student demonstrates an in-depth knowledge of the material. That is, the student must answer the basic question correctly. They can then get an elaboration point if they give ADDITIONAL information, demonstrating that they truly understand the subject matter.
2. (c) 5 points possible; 4 points internal maximum

Up to 3 points for three different (acceptable) methods of control (see list below)

If students give at least two methods of control (indicating at least a basic understanding of IPM) they may earn:

1 elaboration point each (up to 2 points) for elaboration of a method of control

Integrated Pest Management

A combination of methods to control a pest. These may include limited and specific use of chemical, biological, and physical controls. The aim of IPM is long-term control (not eradication) of a pest, with minimal environmental impact.

Legitimate IPM control for ticks

PHYSICAL CONTROLS

Habitat management:

- Short grass, brush reduction (less than 6 inches in height)
- Rotation of pastures/ run areas
- Expose areas to more direct sunlight (higher soil temperature, lower soil moisture, lower humidity)
- Controlled burning (of brush)
- Introduce a tick-repellant plant
Question 2 (cont.)

**BIOLOGICAL CONTROLS**

- Introduce a tick predator (e.g., birds, wasps, ants)
- Introduce a disease that will affect only ticks
- Introduce a competitor to the tick
- Interrupt tick breeding cycle, e.g., sterile male; pheromones
- Control host population by reasonable means, including (but not necessarily limited to) the following:
  - Decrease mouse and/or deer population by introduction of a predator
  - Lengthen the hunting season for deer
  - Inoculate the host (only reasonable for deer)
  - Introduce a tick controlling substance to the host (NOT a pesticide); e.g., hormone disrupter or type of medicine on acorns that will be ingested by mice and deer
    - Simply stating “control host population” is not an acceptable answer. Student must include some (general) method of control.
    - Controlling the host population by a method such as increasing the gypsy moth population, which will defoliate trees, reducing the acorn population and thus limit mice and deer populations is NOT a reasonable technique.
    - Likewise, genetic engineering of oak trees, deer, and/or mice is not a reasonable technique.

**CHEMICAL CONTROLS**

**Pesticide use:**

- Must show an understanding of restricted or judicial use of pesticides in IPM (e.g., should give some indication of timing, place, type, or amounts of pesticide to be used)
- It is not necessary to name a specific pesticide

**Herbicide use:**

- Must show an understanding of restricted or judicial use of herbicides in IPM (e.g., should give some indication of timing, place, type, or amounts of herbicide to be used)
AP® ENVIRONMENTAL SCIENCE
2001 SCORING GUIDELINES

Question 3

3. (a) 10 points possible — 9 points maximum

2 points possible for identifying two indoor air pollutants: Students earn 1 point for each specific indoor air pollutant identified if they have accurately discussed one or more of the items asked for in (i), (ii), (iii), or (iv).

0 points are earned for merely identifying one or two pollutants with no other information.

(i) 2 points possible

1 point for correctly identifying a building type appropriate for each pollutant identified. Type of building must be appropriately linked to source of pollutant. For example:

“older buildings” for asbestos or lead
“newer buildings” for formaldehyde or VOC’s
“houses with wood-burning stoves” for carbon monoxide

(ii) 2 points possible

1 point each for correctly identifying a source for each pollutant identified (see chart). If the source designated is exterior to the building, the respondent must provide an appropriate method of introducing the pollutant to the inside environment (see chart).

(iii) 2 points possible

1 point each for correctly identifying a human health effect for each pollutant identified (see chart).

(iv) 2 points possible

1 point each for correctly identifying a method of prevention or cleanup for each pollutant identified (see chart).
3. (b) 2 points maximum

(i) 1 point earned for an explanation of term “sick building” such as:

- “sick building” is a term which refers to a building in which a number of people report adverse health effects that they believe are related to the time they spend in the building
- “sick building” refers to a building in which air pollution brings about/causes a number of debilitating health effects
- “sick building” is a term used to describe a building in which occupants suffer persistent symptoms that disappear when they go outside
- “sick building” refers to a building which contains unhealthy levels of indoor air pollutants

(ii) 1 point for one of the following:

- When people report relief of symptoms (adverse health effects) when outside the building.
- When 20% or more of the occupants report some adverse health effect when inside the building.
- When occupants report any of the following symptom(s). Students must specify a minimum of two symptoms for one point.
  - Chronic respiratory problems/irritation of mucous membranes
  - Sinus infection
  - Sore throat
  - Irritability
  - Forgetfulness
  - Asthma
  - Shortness of breath
  - Hypersensitivity and Pneumonitis
  - Humidifier fever
  - Depression
  - Nerve disorders
  - Kidney/Liver damage
  - Ear infections
  - Reduced lung function
  - Onset of chest pain
  - Allergic reactions/responses
  - Muscle twitching/tingling sensation
  - Headaches
  - Rashes/skin irritation
  - Eye irritation
  - Impaired vision

- When a student indicates a method to determine the criteria listed above. For example, determining the levels of chemicals present or percentage of people with health effects.
In the chart that follows on pages 12 through 19:

I.V. = Improved Ventilation
TSRM = Tobacco Smoke Reduction Methods — Stop smoking, smoke outdoors, legislative measures (banning, taxing, etc.)

Question 4

4. (a) 3 points maximum

1 point for indicating that animal waste is likely to be contaminating the water IF it is supported by a rational explanation of the data.

1 point for linking the decrease in dissolved oxygen level to decomposition of animal waste and/or an increase in biochemical oxygen demand.

1 point for linking the increase in nitrate level and/or an increase in phosphate level to their presence in animal waste.

1 point for using the trend in stream recovery, in regard to the water quality results, as evidence of contamination by animal waste.

4. (b) 3 points maximum

1 point for stating each water test and an appropriate pattern expected from sites A through D for that test. Only the first two tests given are graded.

1 point only for a descriptive elaboration of the parameter, OR method of testing, of ONE or BOTH of the stated tests.

Examples of suitable water tests include:

Fecal Coliform/Coliform, Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Temperature, Turbidity/Total Suspended Solids (TSS), Heavy metals, (e.g., lead, mercury, cadmium), Carbon dioxide, Nitrite, Salinity, Ammonia, Other macro or micronutrients (e.g., K, S), Chlorine, Iron, Selenium, Hardness, Sulfate, Sulfite, Methane, Conductivity/Total Dissolved Solids (TDS), Alkalinity/Acid Neutralizing Capacity (ANC), Color, Odor, Synthetic organics, (e.g., pesticides, PCBs), Qualitative Habitat Evaluation Index (e.g., stream substrate analysis), Biodiversity Index – the different numbers and types of species, (e.g., macroinvertebrates, bacteria, algae, amphibians, fish, plants).
4. (c) 3 points maximum

Only the first described sequence is graded. Credit will only be given for ecological changes that are linked to the presence of animal waste and are connected to a single sequence.

0 points would be awarded for simply stating that ‘eutrophication’ occurs.

An example of a suitable sequence could be:

1 point for indicating that as stream fertility increases due to higher nitrate/phosphate levels, an algal bloom occurs.

1 point for indicating that as the dead algae and/or organic materials are decomposed, a reduction in the level of dissolved oxygen occurs.

1 point for indicating that an increase in suspended solids could lead to an increase in temperature and/or a decrease in the rate of photosynthesis, resulting in lower dissolved oxygen levels.

1 point for indicating that a shift in benthic plants, phytoplankton, macroinvertebrates, and/or fish communities would result from a specific cause.

1 elaboration point is possible for identifying a suitable species as the example of a shift in biodiversity.

Suitable examples of an indicator species could be:

<table>
<thead>
<tr>
<th>Pollution sensitive</th>
<th>Somewhat pollution tolerant</th>
<th>Pollution tolerant</th>
</tr>
</thead>
<tbody>
<tr>
<td>caddisfly larvae</td>
<td>beetle larvae</td>
<td>aquatic worms</td>
</tr>
<tr>
<td>hellgrammite</td>
<td>clams</td>
<td>blackfly larvae</td>
</tr>
<tr>

<td></td>
<td>alderfly larvae</td>
<td></td>
</tr>
<tr>
<td></td>
<td>atherix</td>
<td></td>
</tr>
<tr>
<td></td>
<td>bass</td>
<td></td>
</tr>
</tbody>
</table>
Other acceptable species could include: duckweed, pfiesteria.

**1 point only** would be awarded for indicating that a human health effect could occur from the contaminated water. For example, if humans are exposed to water with high fecal coliform counts, from human or animal wastes, other organisms may also be present that could lead to diseases such as typhoid fever, hepatitis, gastroenteritis, dysentery, and ear infections.

4. (d) **2 points maximum**

**1 point each** for describing any two of the following provisions of the Clean Water Act. Only the first two stated examples are graded.

The Clean Water Act serves to:
- regulate the discharge of pollutants into U.S. waterways
- attain water quality levels that make these waterways safe to fish and/or swim in
- restore and maintain the chemical, physical, and biological integrity of the nation’s water
- set water quality standards to limit pollutants
- require states and tribes to complete an assessment of all state rivers impacted, or potentially impacted, by non-point pollution (Section 319)
- reduce polluted runoff from urban areas and animal feeding operations (Section 319)
- provide enforcement mechanisms (e.g. civil actions/criminal penalties) to ensure compliance
- develop management plans to address problems
- establish ongoing monitoring of local waterways
- require discharge permits for effluent emissions
- provide financial assistance to fund improvements/education/training
- prevent habitat destruction
- establish best practical control technology (BPT) to reduce pollution
- establish best available, economic achievable technology (BAT) to reduce toxics
- establish best management practices (BMPs) to reduce pollution.
