AP[®] BIOLOGY 2015 SCORING GUIDELINES

Question 4

Both mitosis and meiosis are forms of cell division that produce daughter cells containing genetic information from the parent cell.

(a) **Describe** TWO events that are common to both mitosis and meiosis that ensure the resulting daughter cells inherit the appropriate number of chromosomes.

Description (1 point each; 2 points maximum)

- Spindle elements (microtubules) form/attach to chromosomes
- Chromatin condenses
- Alignment of chromosomes across center of cell prior to chromosome separation
- Separation of chromatids/centromeres to daughter cells
- G2/M checkpoint occurs in both processes
- Replication or synthesis of DNA precedes mitosis/meiosis
- Cytokinesis separates daughter cells after mitosis/meiosis
- (b) The genetic composition of daughter cells produced by mitosis differs from that of the daughter cells produced by meiosis. **Describe** TWO features of the cell division processes that lead to these differences.

Feeture	Description (1 point each row; 2 points maximum)			
Feature	Mitosis	Meiosis2 divisions/ 4 cells result• Half of parent cell• Haploid• (4n>2n; 2n>n)		
Number of divisions/ number of resulting cells	1 division/ 2 cells result			
Ploidy of daughter cells	 Same as parent cell Diploid (2n>2n or n>n) 			
Chromatids separate	Occurs	Not in meiosis I/only in meiosis II		
Crossing over	Does not occur	Occurs		
Homologous chromosomes separate/independently assort	Does not occur	Occurs		

- 4. Both mitosis and meiosis are forms of cell division that produce daughter cells containing genetic information from the parent cell.
 - (a) **Describe** TWO events that are common to both mitosis and meiosis that ensure the resulting daughter cells inherit the appropriate number of chromosomes.
 - (b) The genetic composition of daughter cells produced by mitosis differs from that of the daughter cells produced by meiosis. Describe TWO features of the cell division processes that lead to these differences.

 - (b) The genetic composition of daughter cells produced by mitosis differs from that of the daughter cells produced by meiosis. **Describe** TWO features of the cell division processes that lead to these differences.

The Both mitosis and meiosis are forms of
Cell division in the produce doughter cells
genetic information. In both processes, chromosomes,
ine up in the middle of the cell ond they
Because This ensures that the daughter cells have
the appropriate amount of chromosomes. Cells also have
chuckpoints during the cell cycle in which they
make are they have the right amount of chromosomes
in order to function properly and if the cell
does not have everything it needs, it flags itself and
apoptosis, or better known as cell suicide, accurs.
Mitosis is a process of cell division where
two identical copies of the parent cell are
created. The cell only splits are offer the
chromosomes are appied and it inesults in two diploid
cells. Meiosis is these process of cell division where
gameties (oggs or sperm) are created. This differs
from, mitosis because the parent cell splits twice
resulting in four haploid cells, each with different

AP[®] BIOLOGY 2015 SCORING COMMENTARY

Question 4

Ouestion 4 was written to the following Learning Objectives in the AP[®] Biology Curriculum Framework: 3.3, 3.8.

Overview

This questions was based on a comparison of cell division processes. Students were asked to describe two events common to both mitosis and meiosis that ensure the proper allocation of chromosomes to daughter cells. Students were then asked to describe two features of mitosis and meiosis that result in the contrasting genetic composition of daughter cells after both cell division processes.

Sample: 4A Score: 4

The response earned 1 point in part (a) for describing the separation of chromatids as an event common to mitosis and meiosis. The response earned 1 point for describing the lining up of chromosomes along the middle of the cell as an event common to mitosis and meiosis.

The response earned 1 point in part (b) for describing that meiosis results in four cells and mitosis results in two cells. The response earned 1 point for describing that meiosis produces haploid cells and mitosis produces diploid cells.

Sample: 4B Score: 3

The response earned 1 point in part (a) for describing that chromosomes line up in the middle of the cell as an event common to mitosis and meiosis.

The response earned 1 point in part (b) for describing that meiosis results in four cells and mitosis results in two cells. The response earned 1 point for describing that meiosis produces haploid cells and mitosis produces diploid cells.

Sample: 4C Score: 2

The response earned 1 point in part (b) for describing that in mitosis cells undergo only one division and in meiosis cells undergo two divisions. The response earned 1 point for describing that mitosis produces diploid cells and meiosis produces haploid cells.
