Short Answer Question 4

Use the table below to answer all parts of the question that follows.

Percent of the workforce employed in each sector of the economy in France, 1800–2012

<table>
<thead>
<tr>
<th>YEAR</th>
<th>AGRICULTURE</th>
<th>MANUFACTURING (INCLUDING CONSTRUCTION)</th>
<th>SERVICES</th>
</tr>
</thead>
<tbody>
<tr>
<td>1800</td>
<td>64%</td>
<td>22%</td>
<td>14%</td>
</tr>
<tr>
<td>1900</td>
<td>43%</td>
<td>29%</td>
<td>28%</td>
</tr>
<tr>
<td>1950</td>
<td>32%</td>
<td>33%</td>
<td>35%</td>
</tr>
<tr>
<td>2012</td>
<td>3%</td>
<td>21%</td>
<td>76%</td>
</tr>
</tbody>
</table>

a) Based on the table and your knowledge of history, identify and explain TWO broader trends that contributed to the changes in the patterns of employment in France between 1800 and 2012.

b) Based on the table and your knowledge of history, identify and explain ONE effect of the economic transformations reflected in the table on Western European societies.

0–3 points

Score 3
Response accomplishes all three tasks set by the question.

Score 2
Response accomplishes two of the tasks set by the question.

Score 1
Response accomplishes one of the tasks set by the question.

Score 0
Response accomplishes none of the tasks set by the question.

Score —
Is completely blank

Scoring Guide

0–3 points
- ONE point for identifying a specific example of a broad trend AND explaining how that broad trend contributed to changes in the patterns of employment in France in the period between 1800 and 2012.
- ONE point for identifying a specific example of a broad trend that is DIFFERENT from the one provided above AND explaining how that broad trend contributed to changes in the patterns of employment in France in the period between 1800 and 2012
- ONE point for identifying a specific example of an effect on economic or social life in Western Europe AND explaining how that effect resulted from the transformations reflected in the table.

Scoring Notes

General scoring considerations for Part A:
- The prompt requests that the response address the time period from 1800 to 2012, which could occur in one of two ways. First, the response could cover the entire period in discussing each one of the trends to be identified and explained. Second, each of the trends could cover a part of the period, but taken together the full period is addressed. If the response only addresses a part of the period (e.g., only the nineteenth century, only the twentieth), it may receive a maximum of one point for the task even if the identification and explanation of both trends is acceptable.
- This task focuses on understanding causes and explaining causal relationships. Consequently, the responses need to indicate clearly how the trend contributes to the phenomena (organization of the French workforce over time) described in the table. Attention must also be paid to the temporal context. Answers that make sense for the twentieth century, for instance, may not be persuasive in relation to the nineteenth-century context.
- The task also requires that two distinct trends be identified and explained. If the response only examines two consequences of one trend, it can only receive a single point.

Acceptable responses for part A that would earn credit:
- The Industrial Revolution resulted in the growth of the manufacturing sector. Moreover, by attracting workers from rural areas, it prompted reductions in the agricultural workforce.
- The mechanization of agriculture promoted productivity gains that decreased the need for agricultural workers.
- Increased international competition for industrial markets after 1950 resulted in decreased demand for industrial labor, but it also encouraged a shift towards the service sector, which explains the spike in the service workforce after 1950.
- Improvements in educational access (mandatory primary schooling, expansion of university education [later]) contributed to the expansion of service-sector employment.
- Technological progress decreased the needs for massive human resources in the agricultural and manufacturing sectors, permitting the expansion of service-sector employment.
Short Answer Question 4 (continued)

- The emergence of a consumer society after 1950 led to the creation of new employment opportunities in the service sector.
- The expansion of the “modern state” during the nineteenth and twentieth centuries promoted major growth in the service sector (e.g., jobs in education, public health, government).
- The rise of globalization after 1950 resulted in a decline of manufacturing jobs in France as traditional industrial work could now be accomplished more cheaply elsewhere.

Note: Students often speak of an “agricultural revolution” in this question, but without a great deal of precision.

General scoring considerations for part B:

- This task emphasizes explaining the effects of the transformations suggested in the table. The response must, therefore, clearly focus on explaining how the trends reflected in the table had an impact on Western European social or economic life.
- Note, too, that this task does not require that the response address the entire period covered in the table.

Acceptable responses for part B that would earn credit:

- The growth in manufacturing jobs contributed to urbanization, since the new jobs in industry tended to be concentrated in cities.
- The expansion of the workforce in manufacturing (especially industry) promoted the rise of ideologies like socialism and communism and also union movements, since they sought to improve workers’ lifestyles and promote the cause of social equality.
- The shift from agricultural to manufacturing and service labor permitted individuals (and the working classes in particular) to save money and spend less time working, thereby contributing to the spread of leisure activity and consumerism.
- The growth in manufacturing jobs and industrial conditions undermined traditional notions of family life and familial relations.
- An increase in manufacturing jobs prompted the emergence of new social classes such as the “proletariat” and the “bourgeoisie” and a heightened awareness of social difference.
- The steady increase in service-sector employment reflected both an expansion of the middle class in Western Europe and, overall, long-term improvements in the standards of living.
Industrialization created more construction and industrial jobs all across Europe. This created new urban environments, and the sheer quantity of service jobs rose. New and flexible educational models and higher literacy rates also created a new working class capable of filling new jobs as they are created. As this shift occurred, family life transformed. The agricultural family life had tightly bonded family ties, which separated due to the advancements represented. Family ties were separated due to how parents were spending less and less time with their parents. Education was also turned into yet another tool of the nation rather than a family trait.
Write your answer to SECTION I: PART B, QUESTION 4 on this page only.

A) IN THE PERIOD BETWEEN 1800 AND 1950 WE SEE
A DECREASE IN AGRICULTURE AND AN INCREASE
IN INDUSTRIAL JOBS. THIS TRENDS IS DUE TO THE
INDUSTRIAL REVOLUTION WHICH BROUGHT MANY
PEOPLE OUT OF RURAL JOBS AND INTO CONSTRUCTION AND
MANUFACTURE.

B) FROM 1950 TO 2012 WE SEE A RAMPANT DECREASE IN
BOTH MANUFACTURING AND AGRICULTURAL PROFESSIONS. THIS IS
LARGELY DUE TO AUTOMATION AND THE TECHNOLOGICAL REVOLUTION
REPLACING MANY OF THESE JOBS.

B) THE TECHNOLOGICAL REVOLUTION PROGED FROM 1950
TO 2012 ALLOWED FOR EFFECTIVE BIRTH CONTROL
METHOD OF SUCH AS THE PILL. THIS ALLOWED FOR A
LARGE INCREASE IN THE SIZE OF WOMEN IN THE
WORK FORCE. CHANGING THE GENDER GAP INC.
Write your answer to SECTION I: PART B, QUESTION 4 on this page only.

a) The employment rate dropped significantly between 1950s to the present. Since the WW2 had gone away, the construction to rebuild Europe gradually finished after 1950s, causing much less demand for manufacturing labor.

The rise of communist economy contributed to an environment that focused on services. The wealth gained from industrial revolution fostered the consumption potential of French people. They wanted to consume more and thus the service rose in respond to the need.

b) The transformation reflected from the data shows the improving living life in Western Europe. As the Western recovered from the damage of the first half of 20th century, their economy also recovered by their coalition and support from USA. Therefore, the agriculture employment dropped dramatically due to their less rely on importing agriculture.

End of response area for Q4
Short Answer Question 4

Overview

This question presented a table showing the percentage of the French workforce employed in the agricultural, industrial, and service sectors for the years 1800, 1900, 1950, and 2012. The questions asked students to explain two trends that contributed to the change in patterns of employment and to explain one effect of the changes.

Sample: 4A
Score: 3

The response earned 2 points in part a). It received 1 point for noting that industrialization created more construction and industrial (manufacturing) jobs. It earned a second point for asserting that new educational models and improved literacy contributed to the expansion of the working class and implying that industrialization caused an increase in service jobs. The response earned 1 point for part b) by observing that the growth in industrial jobs helped to create new urban environments, mentioning that the shift toward more industrial work altered aspects of traditional family life.

Sample: 4B
Score: 2

The response earned 2 points for part a). It explains that the rise of industrial production (1800–1950) resulted in a decrease in farm sector jobs and a rise in manufacturing sector employment. It points out that since 1950 automation and further technological progress have resulted in a “rampant decrease” in both manufacturing and agricultural jobs. The response successfully completes the chronological dimension of part a) in that, taken together, the two trends discussed address the entire period specified in the prompt. The response did not earn points for part b). Neither comment offered at the end of the response (birth control, increased numbers of women in the workforce) is clearly presented as an effect of the workplace transformations described in the table.

Sample: 4C
Score: 1

The response earned 1 point for part a) by explaining how the Industrial Revolution sparked growth in manufacturing jobs after 1950; thereafter, the response asserts that declining construction activity reduced demand for manufacturing labor. The second part of this argument is less convincing, but this does not detract from the overall point. The response attempts to identify a second trend, consumerism, but the explanation is insufficient. The response did not earn any points for part b). Although it identifies changes in the economic and social life in Western Europe (improving standards of living), these changes are not presented as the consequence of the transformations presented in the table.
